

FAC-4

Firehouse Alerting and Control for POCSAG and FLEX Wireless Messaging Systems

The FAC-4 is a highly intelligent alphanumeric paging based firehouse alerting system that instantly controls up to four devices and simultaneously delivers alphanumeric text messages to a serial printer. The device is set to activate upon receiving the proper paging cap code sent from 911 dispatches. Up to four different devices can be activated all with individual time functions. The most common devices to turn on include the PA amplifier, audible wake up alarm, and lights. The most common device turn off is the stove.

The FAC-4 can accept up to 7 different cap codes and have separate relay and time functions per cap code. This allows for different alerting to be accomplished at the same physical location depending upon which cap code is sent. This can be very helpful when fire and medical crews are housed in the same building. Group call capability allows for multiple fire stations to be alerted at the same time when necessary.

The FAC-4 is generally wall mounted in an enclosure with 120 volt AC power cord. Existing firehouse wiring is then connected to the easy wire terminal strip. The unit can also be powered by 12 volt battery back up system.

The FAC-4 has an internal antenna for high gain paging reception. For difficult locations, a BNC connector is included for an external antenna.

Features

- Compatible with any paging system VHF, UHF, or 900MHz.
- Control of up to 8 separate functions in and around the firehouse.
- Alphanumeric text delivery to digital signs or serial printers.
- Seamless integration with any existing CAD system.
- Simultaneous activation with personal pagers and other similar control devices.
- Vast grouping capability. Instant activation of multiple firehouses.
- Complete firehouse wiring terminating in one enclosure with easy to understand terminations.
- Compatible with the entire RAVEN line of notification products and software.
